

PROJECT 1 KICKOFF

Pal App (working title)

The app will provide a social platform for individuals to find other individuals to be their 'pals' to go do different events. There will be events separated by categories, so that people can go to either more formal events like concerts or more low-key events like a walk in the park. This app is trying to solve the problem of urban isolation by bringing people who feel alienated or have social anxiety together in a non-threatening space. The app will ideally feature the ability to swipe through possible buddies.

We expect to implement React, MongoDB, Mongoose, Express.js, Passport.js, Eventful API, Meetup API, google maps API.

Responsibilities:

These individuals are the responsible parties for these areas. That is, everyone is able to contribute where and as needed, but these people hold executive power over decisions in their area and are responsible for implementation.
